

Package context flips a plausible primitive

Same candidate shape, different consumed body state, different Newton diagnostic label.

01 Isolated target primitive

PASS

shape alone settles

- Target cylinder is checked as one body.
- Recorded speed stays below the 0.01 m/s gate.

same candidate

02 Full bed package

FAIL

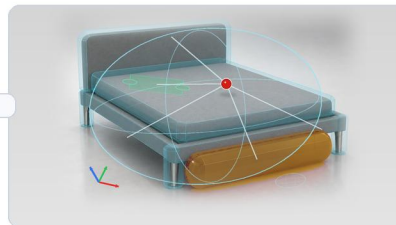

residual speed 0.082 m/s

- The same candidate joins a compound package.
- The consumed body state exceeds the settle gate.

audit

03 Mechanism audit

SUPPORTED

COM / inertia sensitivity

- Mass-only and contact/floor-only checks are insufficient.
- This is a bounded diagnostic, not a broad cylinder claim.

Read this figure as a package-level diagnostic.

Primitive geometry is only a candidate; Newton consumes the whole package and checks body state.

isolated target: pass

bed full package: 0.082 > 0.01 m/s

scoped contrast: 0.00071 <= 0.01 m/s
